19-24 April 2009, Vienna, Austria*

*Annual Rainfall Maxima:  
Large-deviation Alternative to Extreme-  
value and Extreme-excess Methods*

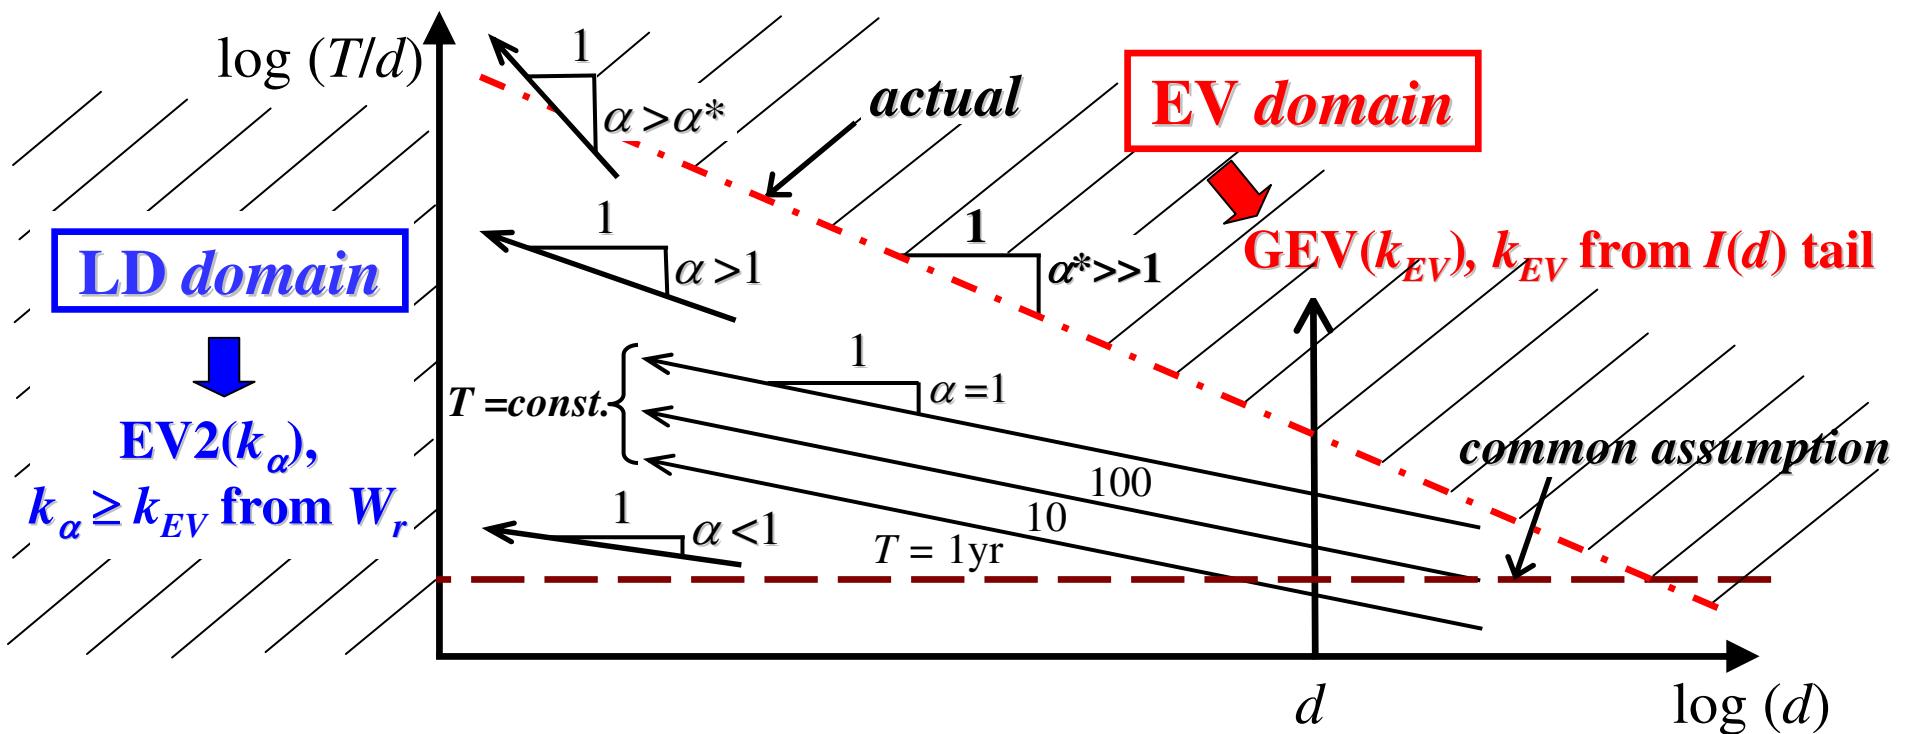

D. Veneziano, A. Langousis and C. Lepore

*Department of Civil and Environmental Engineering, Massachusetts  
Institute of Technology (M.I.T.), U.S.A.*

# The Problem of Rainfall Extremes

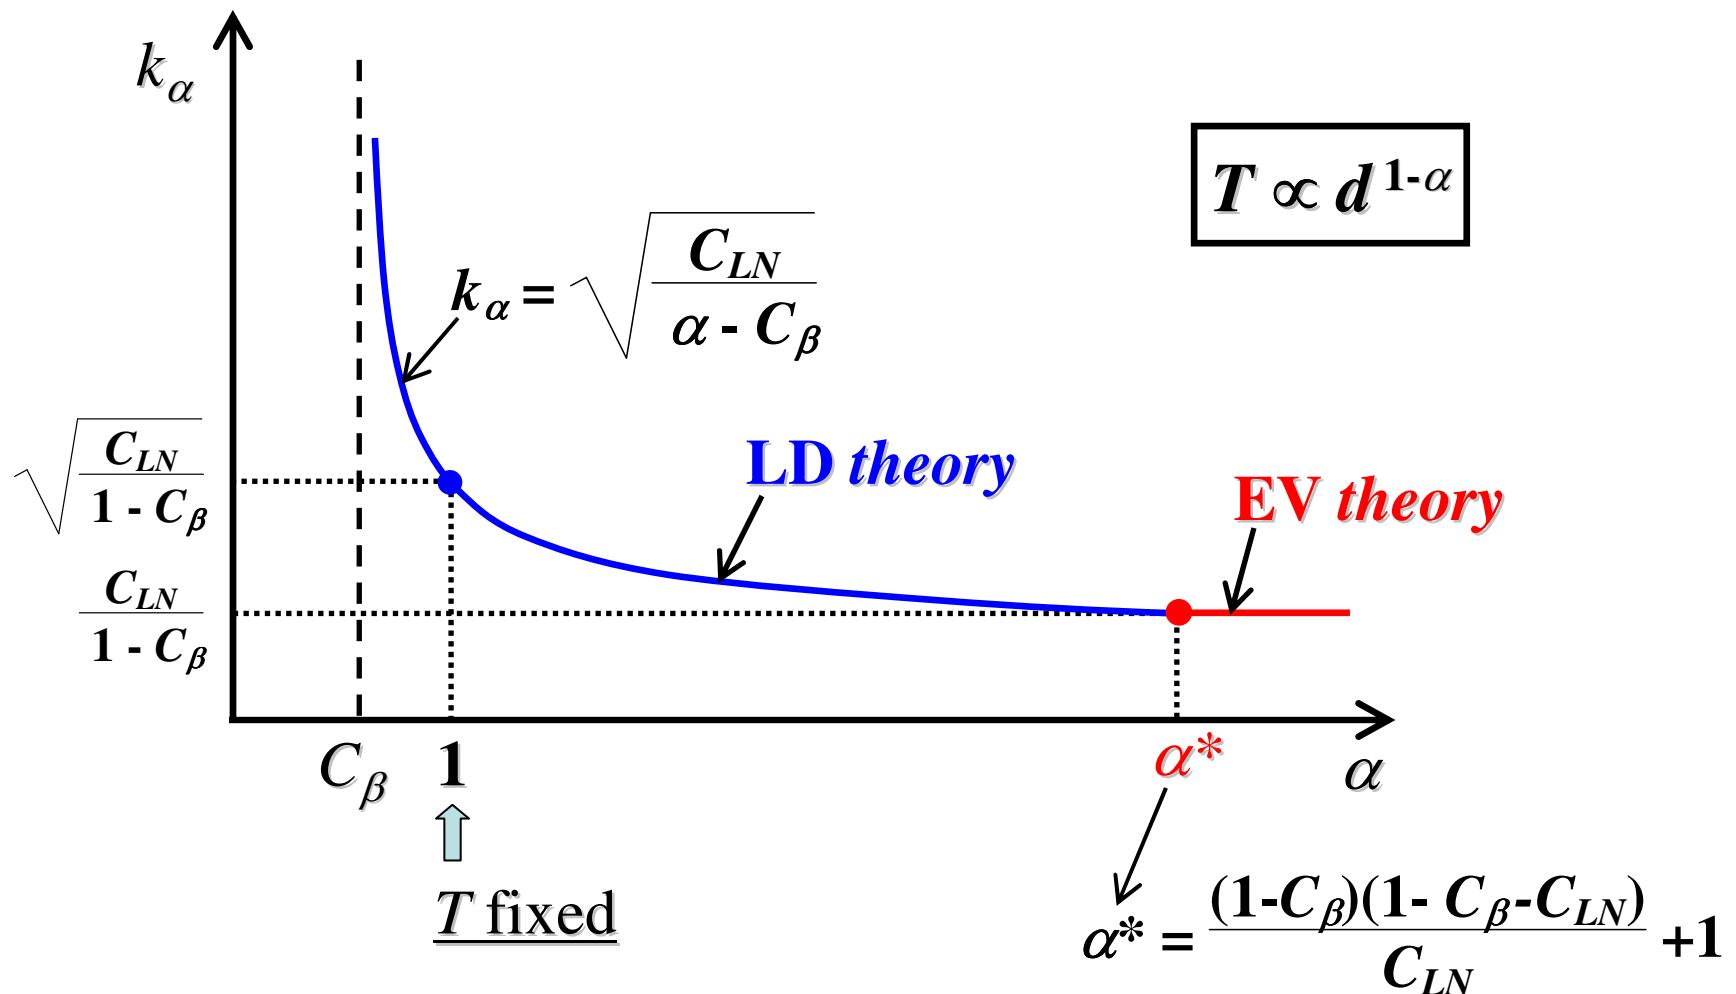

$$\left\{ \begin{array}{l} I_{max,T}(d) = \max \{I_1(d), \dots, I_{T/d}(d)\} \\ \text{MF: } I(d/r) = W_r I(d) , \quad d < D \end{array} \right.$$

## Asymptotics

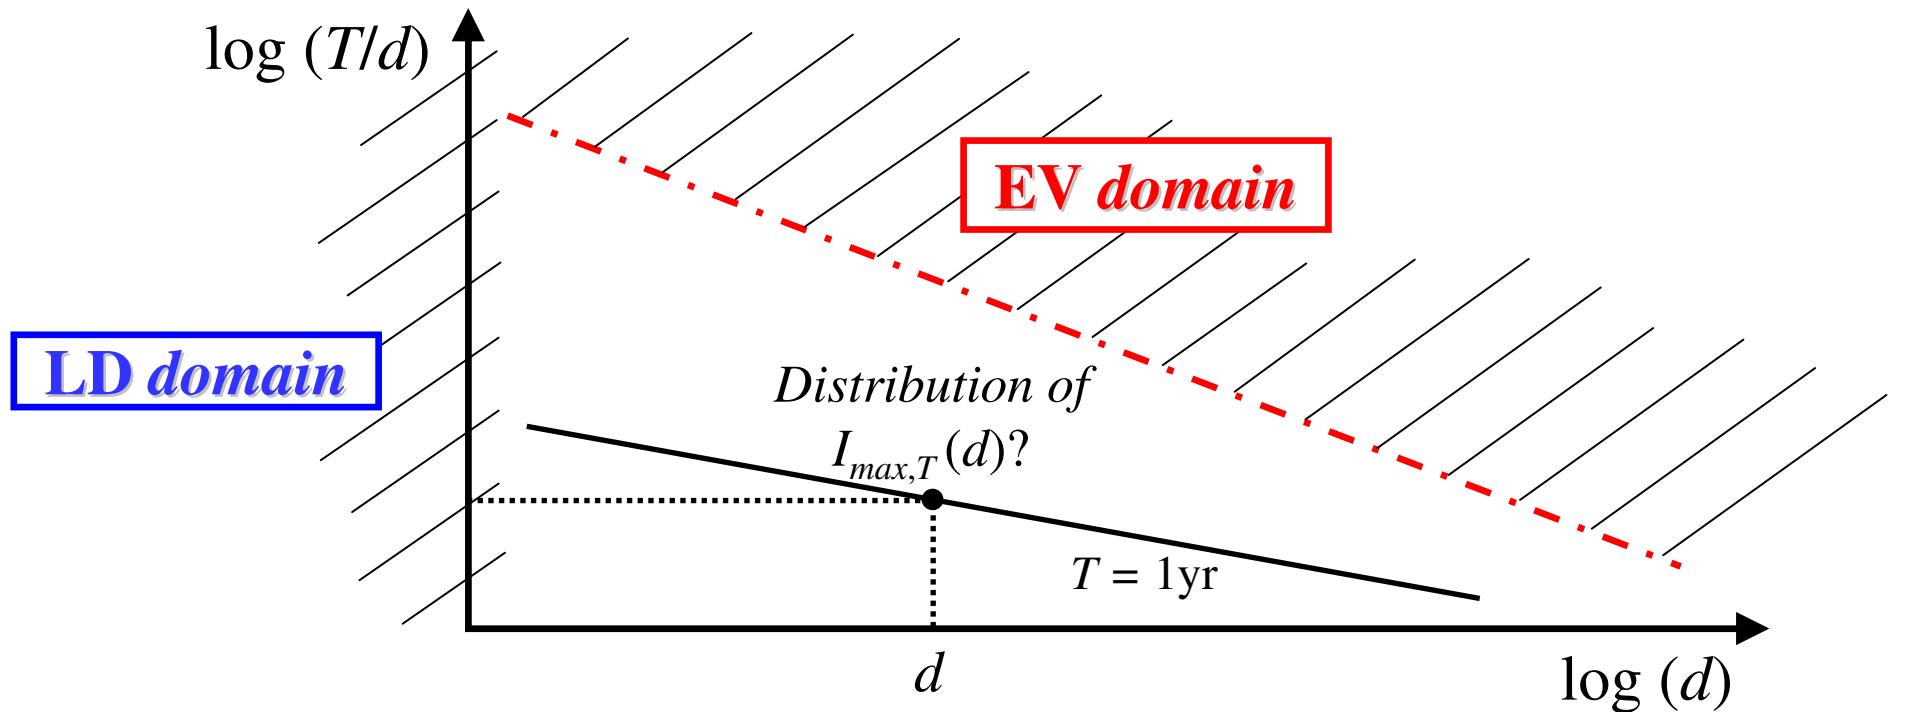

# Asymptotics: Example

- Beta-lognormal MF process with parameters  $(C_\beta, C_{LN})$

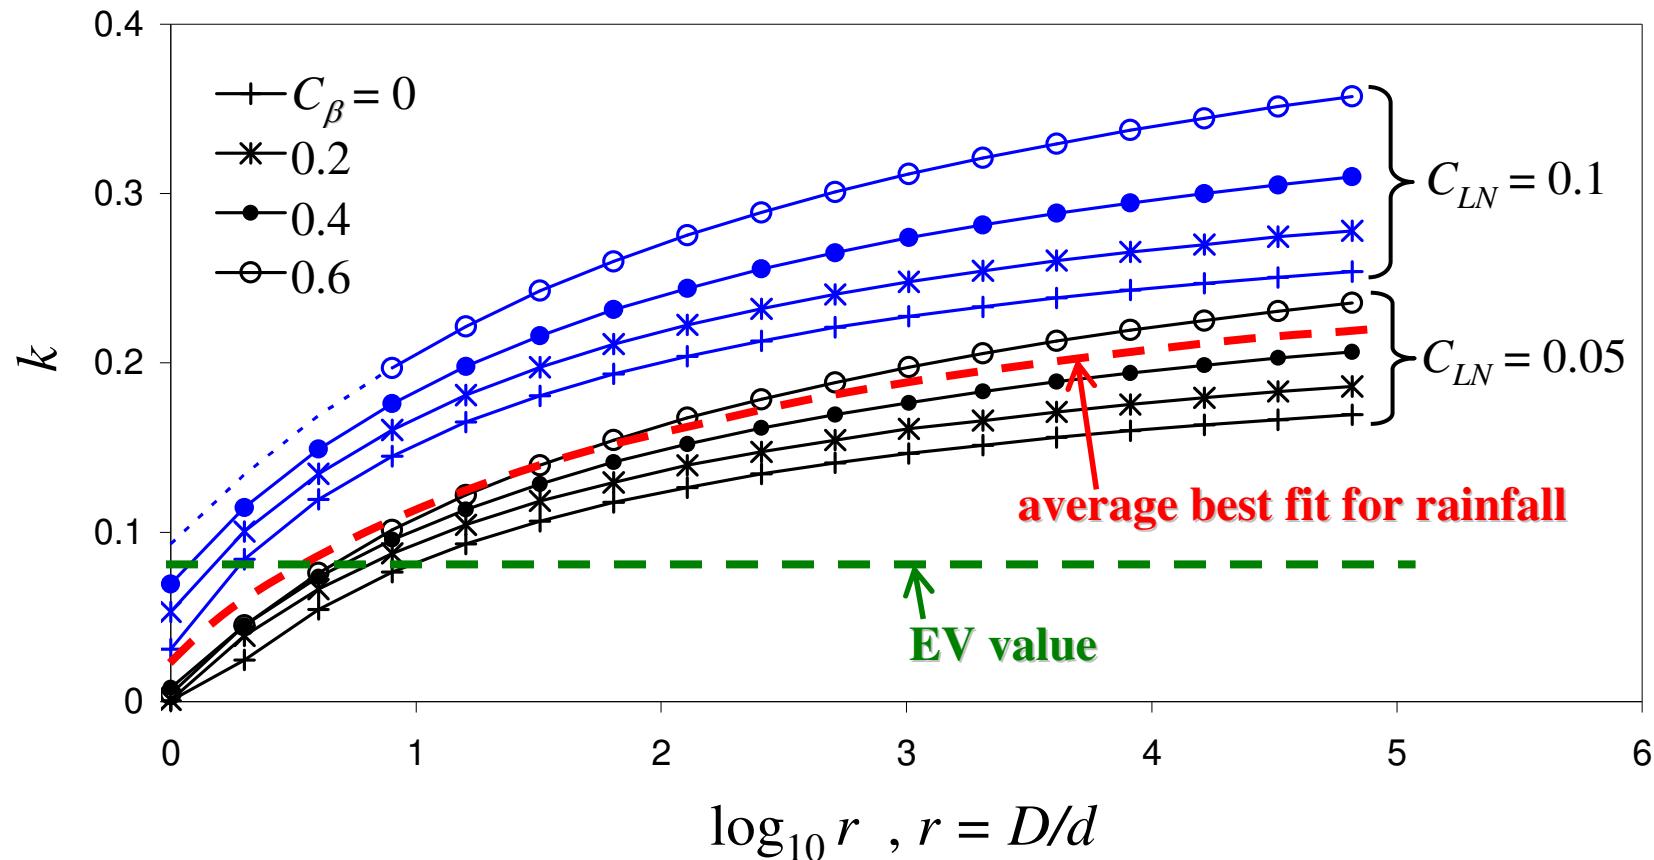

# Non-Asymptotics

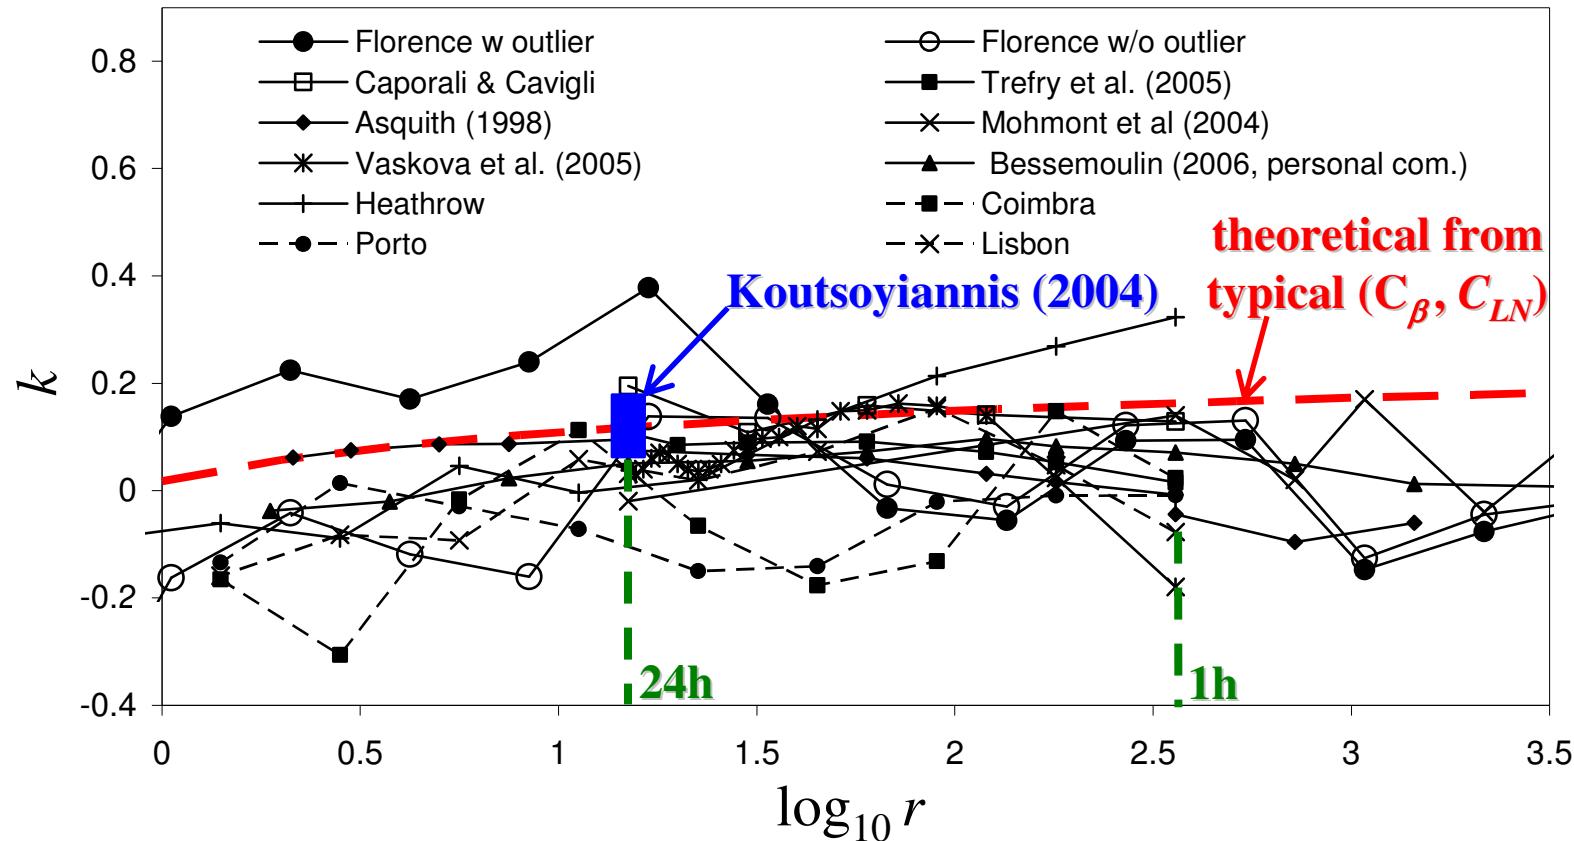

1. Numerical calculation
2.  $GEV(k)$  approximation over a range of return periods

# Example of GEV( $k$ ) Approximation

- $(C_\beta, C_{LN})$  model
- *Return period range: 1-100 years*

# Theoretical and Empirical $k$ Values

- *Large sample variance*
- *Bias of some methods*
- *Deviations from multifractality*

# Conclusions

- The EV conditions are not met by annual rainfall maxima
- LD theory  $\left\{ \begin{array}{l} (d \rightarrow 0, T = \text{const.}) \rightarrow I_{max,T}(d) \sim \text{EV2}(k) \text{ with } k \gg k_{EV} \\ (d = \text{const.}, T \rightarrow \infty) \rightarrow \text{EV theory} \end{array} \right.$
- Non-asymptotics  $\left\{ \begin{array}{l} \text{GEV}(k) \text{ approx. over a range of return periods} \\ \text{Mild dependence of } k(d) \text{ on MF parameters} \end{array} \right.$
- Implications for IDF estimation  $\left\{ \begin{array}{l} \text{Poster\# XY728 (EGU2009-6357)} \\ \text{Thursday, 23 April 08:00–19:30, Halls X/Y} \end{array} \right.$
